conflicting results when munities with high concentrations of asbestos in their drinking water is compared with area without asbestos.)

Frommhagen also said his experience as a water analyst contradicts the water samples. He told improbable that groundwater would have such high concentrations. He said the test results may be wrong and asked the district to submit samples to the EPA for test.

"I just don't think the data is right," Frommhagen added.

Board members said they might do so, but they rejected Frommhagen's proposal that he act as intermediary with EPA. Board member Dan Kriege said the district would contact the EPA direct.

In other business Monday night, the board accepted a \$134,176 bid by test results on the well Water Development of Woodland to drill eight the board he believes it coastal monitoring wells in Capitola and Aptos. Six companies bid on the project, with bids ranging up to \$249,416. The wells will be used to collect water quality data that can be used to determine if there is seawater intrusion into the coastal plain and if there is an groundwater overdraft.
